

TabStash Native Tool

Setup guide for the companion host (Windows)

Step 1 — Extract the archive

Extract the ZIP into the folder where you want to keep the tool. This folder will be its permanent location, so choose it carefully.

Step 2 — Build the host executable

Run `build_host_exe.bat`. This automatically creates an executable (`tabstash_host.exe`) that is used to display the tab list. Once it has been built, start it with a double-click.

Launching it after creation is required: this first run also generates the files needed to store the links.

Name	Date modified	Type	Size
 <code>build_host_exe.bat</code>	20/08/2026 13:53	Windows Batch File	3 KB
 <code>icon48.ico</code>	19/08/2026 00:20	ICO File	1 KB
 <code>README.md</code>	20/08/2026 13:53	MD File	3 KB
 <code>register_firefox_host_v3.bat</code>	19/08/2026 01:42	Windows Batch File	5 KB
 <code>tabstash.bak</code>	20/08/2026 13:53	BAK File	1 KB
 <code>tabstash_host.py</code>	20/08/2026 13:53	Python File	27 KB

Step 3 — Register the host with Firefox

Next, run `register_firefox_host_v3.bat`. This creates a JSON file (`com.tabstash.host.json`) that acts as the link between the tool and the browser.

Name	Date modified	Type	Size
 build_host_exe.bat	20/08/2026 13:53	Windows Batch File	3 KB
 icon48.ico	19/08/2026 00:20	ICO File	1 KB
 README.md	20/08/2026 13:53	MD File	3 KB
 register_firefox_host_v3.bat	19/08/2026 01:42	Windows Batch File	5 KB
 tabstash.bak	20/08/2026 13:53	BAK File	1 KB
 tabstash_host.py	20/08/2026 13:53	Python File	27 KB

Note: if you later move these files to a different folder, delete `com.tabstash.host.json` and run `register_firefox_host_v3.bat` again to regenerate it with the new path.
